
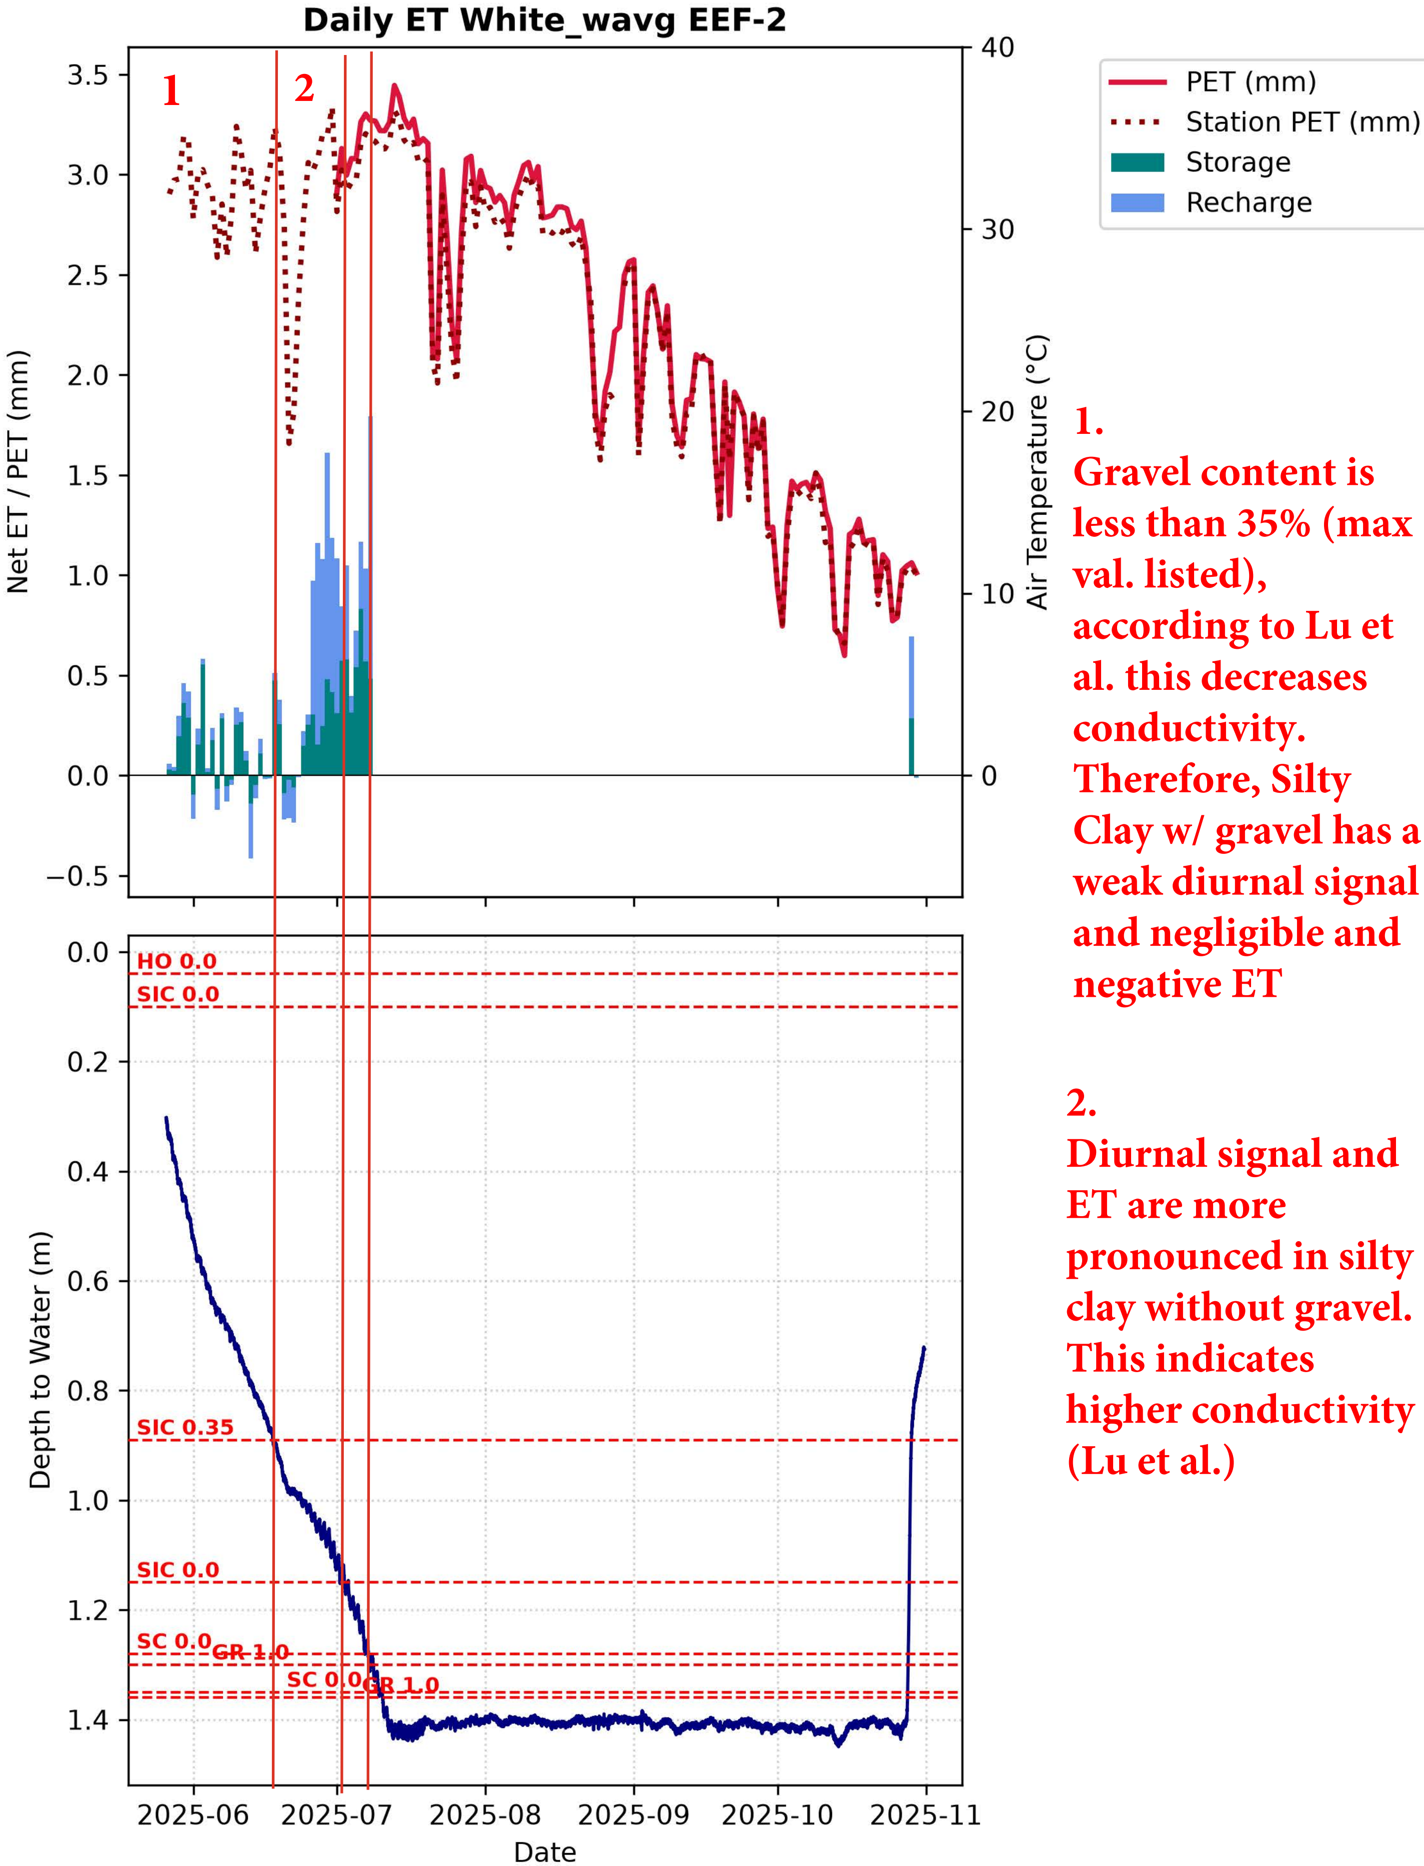
1.
Our current Sy values overestimate Sy. SC has high clay amount (~45%). Loheid 2005 et al. Sy values assume a water table depth of greater than 1 m.
These Sy values should be decreased for depth below 1 m because the capillary fringe for clay soils prevents gravitational drainage.
Duke 1972 states "for a considerable distance above the water table, the water that will drain by gravity is significantly less than the ultimate specific yield."



1.
Gravel content is less than 35% (max val. listed), according to Lu et al. this decreases conductivity. Therefore, Silty Clay w/ gravel has a weak diurnal signal and negligible and negative ET

2.
Diurnal signal and ET are more pronounced in silty clay without gravel. This indicates higher conductivity (Lu et al.)
